

Just Earth Farm – Critical Control Points

1. Well water supplying livestock and facilities is tested quarterly to assure the absence of coliforms or other contaminants in the water.
2. Should coliforms or other contaminants be present in the water, steps will be taken to assure that only coliform-free water is used for livestock consumption and facilities use. Well water will be sanitized, the source of contamination verified, and the water will be retested.
3. Only once well water is retested and verified to be free from coliforms and any other serious contaminants will its use in facilities and for watering livestock be resumed.
